Special Issue: Feature Papers in Blockchains 2026

Dear Editors,

Please consider the Review manuscript entitled “Blockchain-Assisted Mission Trust in Air–Surface–Underwater Unmanned Systems: A Cross-Layer Review and Object–Assurance–Lifecycle Framework” for publication in *Blockchains* and consideration in the Special Issue “Feature Papers in Blockchains 2026.” Author and institutional details are withheld in this file for double-anonymous review and will be supplied through the submission system as required.

The manuscript reviews cross-domain UAV–USV–UUV cooperation, unmanned-system security, trust and reputation, provenance, remote attestation, zero trust, and permissioned blockchain governance. Its principal original synthesis is the Object–Assurance–Lifecycle framework, which distinguishes four mission objects, four non-substitutable assurance layers, and six lifecycle stages. The manuscript also proposes an object-dependency threat grammar, a context–temporal–graph evidence loop, a six-level evidence-maturity ladder, and a future Cross-Domain Unmanned Trust Profile.

The review is closely aligned with the journal because it focuses on when permissioned ledgers materially support multi-organization membership, attestation and provenance commitments, policy/model coordination, audit accountability, and reconciliation after network partition. It also states strict negative boundaries: ledger agreement does not establish physical sensor truth, endpoint integrity, privacy, hard real-time performance, or sound governance. The article reports no new empirical data, experimental results, or protocol-performance claims.

This manuscript is original, is not under consideration elsewhere, and has been approved by all authors. Any related manuscripts and potential conflicts will be disclosed in the submission system. The authors will supply complete CRediT contributions, funding information, affiliations, and corresponding-author details after peer review or whenever the Editorial Office requires them. The manuscript uses only public, defensive evidence and omits sensitive tactics and weapon-effect details.

Generative AI assistance is disclosed in the manuscript. The authors reviewed and edited all output, verified the cited sources to the extent stated in the supplementary evidence inventory, and accept full responsibility for the submission.

Thank you for your consideration.

Sincerely,
