

### **Ledger-supported records**

Under declared key, validation, and consensus assumptions:

Membership and authority records

Attestation and provenance commitments

Agreement on policy / model versions

Audit and reconciliation checkpoints

### **Complementary controls**

Required for the applicable physical and mission-use claims:

Sensor and physical validity

Endpoint and runtime protection

Local safety, fallback, and deadlines

Privacy and legitimate governance

### **Select by required control and guarantees**

Consider a ledger when independently administered parties need joint control of accepted state transitions and cannot appoint an agreed custodian.

### **Compare feasible alternatives**

Evaluate witnessed signed logs and jointly administered replicated databases under matched fault assumptions, availability requirements, workloads, and resource budgets. Select the architecture by achieved guarantees and measured cost.
